OUT-OF-BAND MANAGEMENT

AMD vs Intel

Out-of-band management: Same capabilities, single console

Device management shouldn't slow the pace of productivity. Remote and hybrid teams need IT to reach a downed PC without a site visit, no matter the chip inside it.

Why does out-of-band (OOB) management matter?

OOB management is a secure method for IT teams to remotely monitor and control devices.

Managing PCs from a single console—whether that's the AMD Management Console or comparable Intel® tools—streamlines critical admin activities such as securing devices and troubleshooting issues.

Both AMD PRO and Intel vPro® deliver the same OOB management features

Boot control

Manage the system outside the OS via force-booting into the BIOS, performing a network boot, booting to a removable drive, and more.

Soft shutdowns

Cleanly close processes and unload drivers before shutdown—and automate the process when applying updates—to reduce data loss and hardware risk.

Security configuration management

Leverage the same security capabilities with the AMD or Intel consoles, including HTTPS secure transport, web services management, and user authentication.

Keyboard, video, and mouse (KVM) redirection

Troubleshoot issues without physical access to a system, gaining full remote control even before the OS loads.

AMD PRO matched Intel vPro on every core OOB task.
